# Problem Set 4

## Applied Stats II

Due: April 12, 2024

## Instructions

- Please show your work! You may lose points by simply writing in the answer. If the problem requires you to execute commands in R, please include the code you used to get your answers. Please also include the .R file that contains your code. If you are not sure if work needs to be shown for a particular problem, please ask.
- Your homework should be submitted electronically on GitHub in .pdf form.
- This problem set is due before 23:59 on Friday April 12, 2024. No late assignments will be accepted.

# Question 1

We're interested in modeling the historical causes of child mortality. We have data from 26855 children born in Skellefteå, Sweden from 1850 to 1884. Using the "child" dataset in the eha library, fit a Cox Proportional Hazard model using mother's age and infant's gender as covariates. Present and interpret the output.

```
# Using the child dataset

data(child)

child_surv <- with(child, Surv(enter, exit, event))

# fit a Cox Proportional Hazard model
cox <- coxph(child_surv ~ sex + m.age, data = child)
summary(cox)

# check fit
drop1(cox, test = "Chisq")
stargazer(cox, type = "text")</pre>
```

Results are as follows:

```
stargazer(cox, type = "text")
4 Dependent variable:
6 child_surv
8 sexfemale
                                   -0.082***
  (0.027)
11 m. age
                                   0.008***
(0.002)

                             22.518*** (df = 2)
  Score (Logrank) Test
                             22.530*** (df = 2)
23 Note:
                         *p < 0.1; **p < 0.05; ***p < 0.01
    > \exp(-0.082)
    [1] 0.921272
    > \exp(0.008)
    [1] 1.008032
```

**Interpretation**: There is a 0.082 decrease in the expected log of the hazard for female babies compared to male, holding mother's age constant. There is a 0.008 increase in the expected log of the hazard for babies of mothers as they age by a year, holding sex constant.

By exponentiating the parameter estimates to obtain hazard ratios, we find that the hazard ratio of female babies is 0.92 that of male babies, i.e. female babies are less likely to die (92 female babies die for every 100 male babies; female deaths are 8 per cent lower, etc.)

#### Presenting the results:

```
cox_fit <- survfit(cox)
autoplot(cox_fit)
```

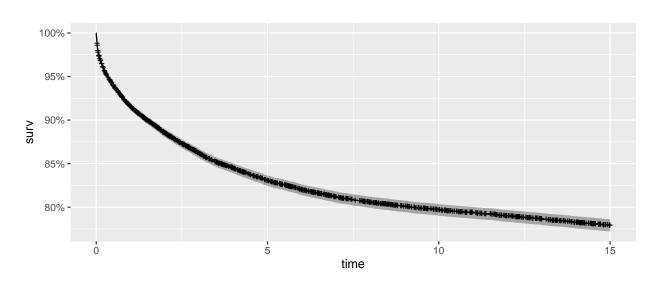

Figure 1: Hazard Function Results

We can also visualise the cumulative hazard function.

```
plot_COXPH <- coxreg(child_surv ~ sex + m.age, data = child)
plot(plot_COXPH)</pre>
```

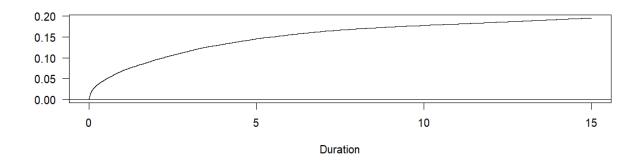

Figure 2: Cumulative Hazard Function

The following plot provides a visualisation of the difference across genders, using an average age for the mother.

```
2 newdat <- with (child ,</pre>
3 data.frame(
4 \text{ sex} = c ("female", "male"), m. age = rep (mean (m. age, na.rm = TRUE, 2))
6)
8 # using an average age
9 fit <- survfit(cox, newdata = newdat)</pre>
  plot(survfit(cox, newdata = newdat), xscale = 1,
conf.int = T,
y \lim = c(0.75, 1),
  col = c("red", "blue"),
  xlab = Time,
  ylab = "Survival proportion",
  main = ""
  legend ("bottomleft",
19 legend=c("Male", "Female"),
1 t y = 1
col = c("red", "blue"),
22 text.col = c("red", "blue"))
```

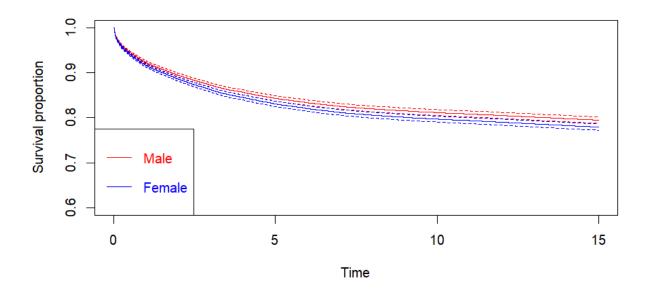

Figure 3: Comparison of survival rate for male and female children using an average age for mothers

The following graph provides a visualisation of the difference in life expectancy for male and female children when the mother's age is at 20 and 40.

```
newdat20 <- with (child, expand.grid (m.age = c(20, 40), sex = c("male", "female
      ")))
plot (survfit (cox, newdata = newdat),
4 \text{ xscale} = 0.30,
5 conf.int = TRUE,
6 ylim = c(0.75, 1),
  col = c("red", "blue", "green", "black"), # Specify colors for each age group
      and sex
8 xlab = "Time",
9 ylab = "Survival proportion",
main = "")
  legend ("topright",
<sup>12</sup> legend=c("Male (20)", "Male (40)", "Female (20)", "Female (40)"),
13 \text{ lty} = 1,
14 col = c("red", "blue", "green", "black"),
15 text.col = c("red", "blue", "green", "black"),
16 \text{ cex} = 0.6
```

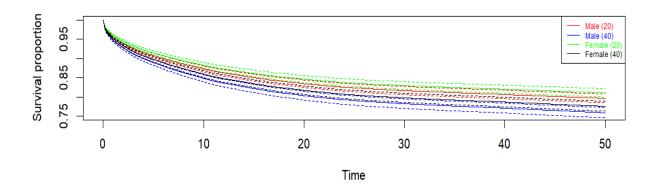

Figure 4: Difference in life expectancy for children (male or female) when mother's age is at 20 or 40
